2006 Polaris Fusion 600 stage tuning and Single pipe comparison DRAFTED ON 6/6/06

Dave Mitchell AKA Shylock 44 brought us his well- seasoned (700 mile) 06 Fusion 600 for "stage tuning". Stage tuning offers various cost modifications, and consumers can see the real cost/ HP value of each mod.

Supervising this session was Sean Ray, who has been a great help to Tim Bender the last two seasons developing engine/ chassis/ clutch combos that assured Polaris SnoX guys a good hole-shot percentage and competitive racing. Sean also built his dad's 660 Fusion, and these same pipes fitted to his sled will be posted shortly. Sean has been a great help to me as well, spending several years now as a Delphi dyno operator Sean has learned some new means to create even better repeatability from run to run.

Also helping out were Dan and Dan, who have been trading dyno time and dyno help for chassis and clutch tning on my 192HP HTG XCR 800 Edge pump gas triple and 100 HP XLT600.

Airflow numbers and A/F ratio readings are deleted here, since I suspect less than operfect fit of boots to carbs caused wide variation in airflow CFM from run to run. Every time jets or reeds were changed, airflow CFM would also be skewed enough that that info was useless.

We also tested loud aftermarket can mufflers on the stocker—their addition to HP was minimal or worse, twice or more the sound level, I have that data that I will begrudgingly post along with the Fusion 660 (the big bore was, however, happier with a few barking but higher flowing CFM cans).

Our baseline on Dave's sled was 124 HP, mid .60's BSFC. Something like 5% Ethanol blended 93 octane gas was used for all tests (could that help out HP with proper tuning?).

First we installed easy stuff—this was DynoPort's prototype stamped Fusion pipe (stamped and very expertly TIG welded, fit perfectly (though stock stealth heatshield would not fit). This pipe created a sad 1 HP increase right at the peak, and little everwhere else. After two repeat runs within a tenth on a HP, this was typical.

Stock 06 Fusion 600, 320 main jets for warm air compensation DynoPort stamped preproduction single pipe, stock muffler

We next installed the SLP single, with polished silver Jet-Hot-like coating on pipe and can. Here, we used the stock muffler to maintain stock dB. The combo of SLP pipe/ SLP can will be posted later.

Stock 06 Fusion 600, 320 main jets

Finally for our bone stocker we installed a stock pipe thast had been modified by Bikeman Performance. This was similar to the F7 BM pipe mods- a ring of steel welded into the center section, and some modification

to the internal stinger created a great combo on the Firecats, and stock heatshields nicely covered the evidence. While on the Fusion 600 peak HP was not much greater than SLPs, Bikeman's HP band was broader—as evidenced by the 500 RPM powerband at 124+

D Stock 06 Fusion 600, 320 main jets for warm air compensation

We left the Bikeman mod stock pipe in place, and had Dan and Dan perform the same airbox mod that Sean had used on his dad's sled. This required popping the airbox halves apart with six flatblade screwdrivers, sliding out the shelf, then bandsawing the airbox top inlet to eliminate the restriction below the top surface of the airbox. We jetted up to 350 to compensate for the lower air pressure inside the airbox; perhaps 360s would have been more ideal. At any rate, let's say one HP for added airflow, one HP for reduced fuel flow. But it's cheap HP for sure.

E 06 Fusion 600, remove shelf and inlet restriction from airbox, 350 mj to compensate for reduced

carb inlet pressure, Bikeman modified stock pipe, stock muffler

Next we removed the stock Vforce-like reed cages and installed three-petal Vforce3 reeds/ reed cages. Note that the Vforce gave us about 2% more fuel flow *and* two percent more HP. We can surmise that airflow CFM is 2% higher as well. After this test, while not shown, we installed a set of Four petal Vforce reed cages which resulted in less HP than stock reeds. It surely takes an instrumented dyno to figure all of this stuff out.

F 06 Fusion 600, mod airbox, 350 mj, Bikeman mod stock pipe/ stock heatshields, stock muffler remove stock reeds install Vforce3 three-petal reed cages

Dan and Dan reinstalled the Vforce 3 three-petal reeds along with Sean Ray's cut head. He had taken a stock head and sliced .017" from the sealing surface. The tighter squish would very likely increase combustion chamber turbulence, and with conservative stock timing the stock 600 twin would surely benefit from increased flame speed (somewhat like adding much-needed timing lead). The higher net compression would also add HP due to higher temp rise (and pressure rise) in the combustion chambers!

I 06 Fusion 600, mod airbox, 340 mj, Bikeman mod stock pipe, stock muffler

VForce3 reeds. Sean's cut head

Now we have a low-buck, stealthily powerful Fusion 600 trail sled (Stock-appearing pipe, stock heat shields and stock quiet muffler). No noise tickets for Shylock44. Keep in mind that in 1989 I dyno tuned Craig Brinster's and Don Lewis' Aaen Wild Wild Wild 660 Polaris triple that after two hours of dyno tuning made a disappointing 128 HP at 9600 (the Aaen catalog suggested 168??). The next day, Sunday, they blew everyone away in Open Mod Stock at the NYS Grass Drag Championships then in Marilla, NY.

Just as we were beginning to tear down Shylock's Fusion to remove it from the dyno my cel phone rang just like Howie Mandell's "Deal or No Deal" Banker phone. It was DynoPort's Rich Daly, having seen the dyno results live on the webcam, he made a \$ offer for us to leave the sled on the table and rent it to us for a day so he could come with his hacksaw and torch set and try to improve his product. Since I had nothing scheduled I said "DEAL". The next AM Rich showed up with his tools, dial calipers, and torches.

When Rich showed up in his blue Viper the next day, we spent some time dicussing his options. We had on the table an SLP single that made good HP but configured much differently than the DynoPort. Plus we had this Bikeman goober-welded stock pipe that was superb, but way different in shape than Dynoport's single (plus I promised Bikeman I wouldn't let anyone autopsy his pipe). Rich's big problem was he has 200 sets of stampings the way they are, and he wanted to pay me for a day to try to make them work

So we re-baselined the engine with stock pipe and muffler, same as yesterday with virtually the same numbers.

06 Fusion 600, new baseline, stock single pipe and muffler, mod airbox 340 main jets VForce3 reeds, Sean's cut head

Out came the bandsaw. Rich added .70" to the stamped DynoPort header pipe but I had to give old time acetylene welder Rich a lesson on eliminating those awful black carbon octopuses (octopi?) that fall out of the sky onto everything when someone lights an acetylene torch with no O2 turned on! Crack the O2 first, then feed lots of acetylene, crack it on with a "snap" with the sparklighter and we are rewarded with a clean shop, and clean clothes. At any rate, here is the DP single with longer header pipe.

N 06 Fusion 600, mod airbox, 340mj, Sean's cut head, VForce3 reeds DynoPort preproduction stamped pipe, add .7" to header pipe

Rich and I have done this dozens of times before, before Rich had his own dyno to drive him nuts. Rich was always a bit leery of my suggestions (since he knew I charge by the hour). But since I had the advantage of having helped Bender, HTG, Crankshop, Hooper, Cyberdyne, D&D tweak tuned pipes here before they had their own dynos, Rich was accepting my input and it was like old times again. This time it was shorten the center section by .50". This resulted in nearly identical peak HP but for some reason much broader HP curve. Check that out. Broad HP is way more imortant than the same HP peak in a tiny area that would require a clutching genius to locate and utilize..

06 Fusion 600, mod airbox, 340 mj, Sean's cut head, VForce3 reeds, stock muffler DynoPort stamped preproduction pipe, .7" added to HP .5" removed from center section.

Finally, Rich hacked off the rear cone of his stamped pipe and brazed on an extra 4 inches of large diameter internal stinger. He welded the rear cone back together and the dyno showed very magical results, losing a bit of midrange HP in exchange for a monsterous pile of HP at or about the HP peak! Fuel flow numbers don't indicate an inordinant drop in airflow. I did at least five repeat tests on this combo, as opposed to the usual two. Rich noted that, he said he never saw me back up a dyno run four times within a few tenths! This was sort of bizarre. When we were satisfied with the refigured DynoPort pipe, I refitted the stock pipe and muffler and the engine repeated within a few tenths of where we began that day.

P 06 Fusion 600, mod aqirbox, 340 mj, Sean's cut head, Vforce3 reeds, stock muffler DynoPort preprod stamped pipe, add .7" HP, remove .5" CS add 4" to internal stinger

Rich grabbed his newly-modified stamped pipe and headed back to his shop for re-jigging. Expect consumer versions to be come with an extra weld in the center section, and a longer-than normal header pipe. It's too bad that the stock heat shields won't fit the DP or SLP pipe like the Bikeman Mod Stocker. It's not a huge issue for everyone, but in the growing areas patrolled by the Barney Fifes, quiet and stock-looking is your friend. Rich will surely send us a final version for testing this fall.
